

SIEMENS

An Introduction to **TTCN-3**

Prof. Dr. Jens Grabowski
University Göttingen, Germany

Dr. Andreas Ulrich
Siemens AG, München, Germany

About the speakers

1(2)

- **Jens Grabowski**

- Is professor for applied computer science at the Institute for Informatics of the University of Göttingen and head of the research group “Software Engineering for Distributed Systems”
- Has the testing-oriented research interests
 - Test methodology, test specification, automatic and user-guided test generation, non-functional testing, testing languages
- Is in the TTCN-3 business since the beginning

About the speakers

2(2)

- Andreas Ulrich
 - Is a Principal Engineer at Siemens' Corporate Technology Division, Software & Engineering Department in München, Germany
 - Provides consultancy services within the company in the area of testing and quality assurance for large software projects
 - Received his PhD in computer science from Magdeburg University in 1998
 - Is active in the research area of software testing
 - Member of the ETSI TTCN-3 maintenance group

Table of contents

- PART I: Overall view of TTCN-3
 - What is TTCN-3
 - Main new aspects of TTCN-3
 - TTCN-3 series of standards
 - Concepts
 - TTCN-3 language elements
 - TTCN-3 test behavior specification
 - Attributes, grouping, and import
- PART II: The test application
 - The CSTA example
 - Test purposes
- PART III: TTCN-3 en detail
 - Test architecture specification
 - Test data definitions
 - Test behavior description
 - Overall view of the test suite for the example
- PART IV: Conclusions and outlook
 - Acceptance of the TTCN-3 ingredients
 - Conclusions
 - TTCN-3 extensions
 - TTCN-3 tool providers
- Literature on TTCN-3

PART I:

Overall view of TTCN-3

What is TTCN-3
Main new aspects of TTCN-3
TTCN-3 series of standards
Concepts
TTCN-3 language elements
TTCN-3 test behavior specification
Attributes, grouping, and import

What is TTCN-3

- A standardised test specification and test implementation language
- Developed based on the experiences from previous TTCN versions
- Applicable for all kinds of black-box testing for reactive and distributed systems, e.g.
 - Telecom systems (ISDN, ATM);
 - Mobile (telecom) systems (GSM, UMTS);
 - Internet (has been applied to IPv6);
 - CORBA based systems.

Main new aspects of TTCN-3

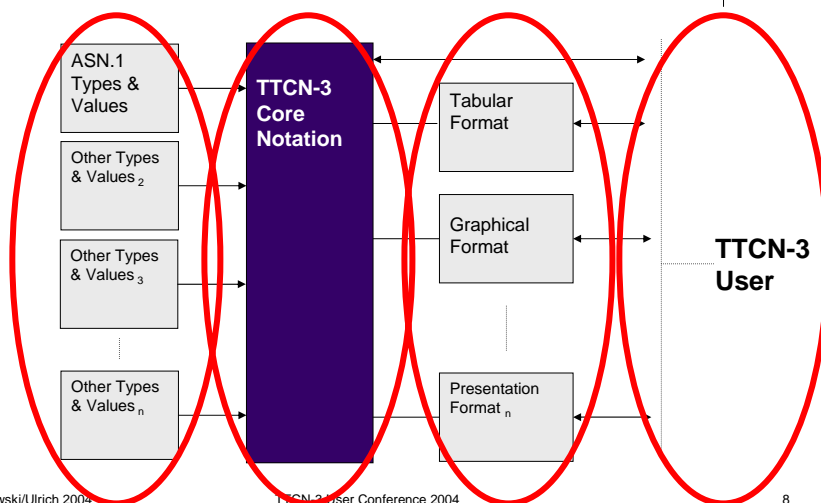

- Triple C
 - Configuration: Dynamic concurrent test configurations with test components
 - Communication: Various communication mechanisms (synchronous and asynchronous)
 - Control: Test case execution and selection mechanisms
- Improved
 - Harmonized with ASN.1
 - Module concept
- Extendibility via attributes, external function, external data
- Well-defined syntax, static, and operational semantics
- Different presentation formats

TTCN-3 User Conference 2004

7

TTCN-3 series of standards 1(3)

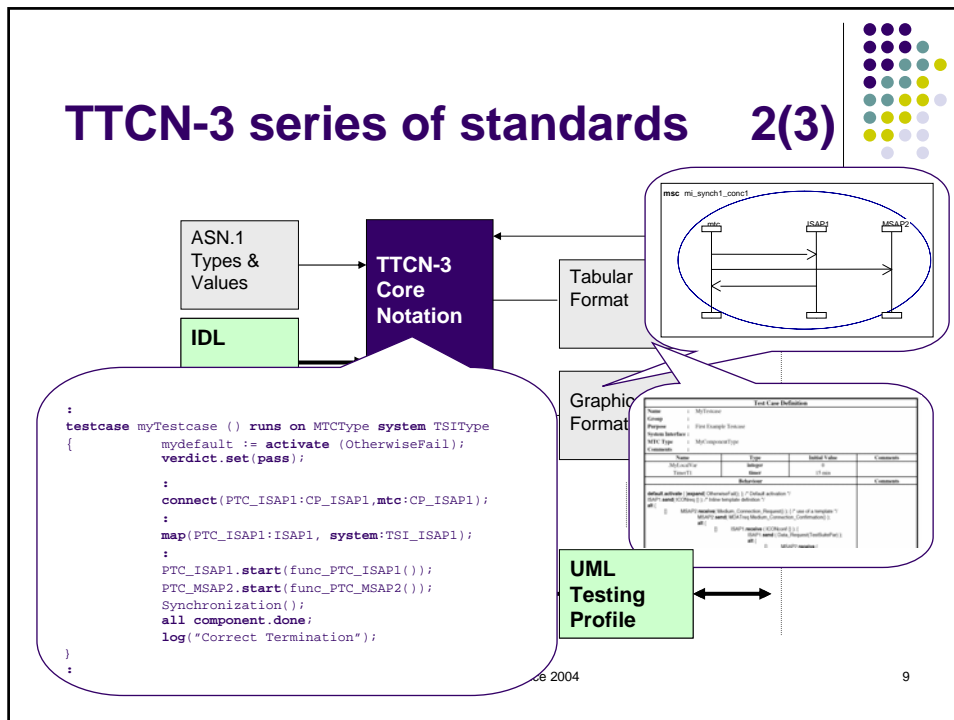

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

8

TTCN-3 series of standards 2(3)

TTCN-3 series of standards 3(3)

- European Standard (ES) in 6 parts
 - ES 201 873-1: TTCN-3 Core Language
 - ES 201 873-2: TTCN-3 Tabular Presentation Format (TFT)
 - ES 201 873-3: TTCN-3 Graphical Presentation Format (GFT)
 - **ES 201 873-4: TTCN-3 Operational Semantics**
 - **ES 201 873-5: TTCN-3 Runtime Interface (TRI)**
 - **ES 201 873-6: TTCN-3 Control Interface (TCI)**
- Additional ETSI Technical Specification (TS)
 - TS 102 219: The IDL to TTCN-3 Mapping

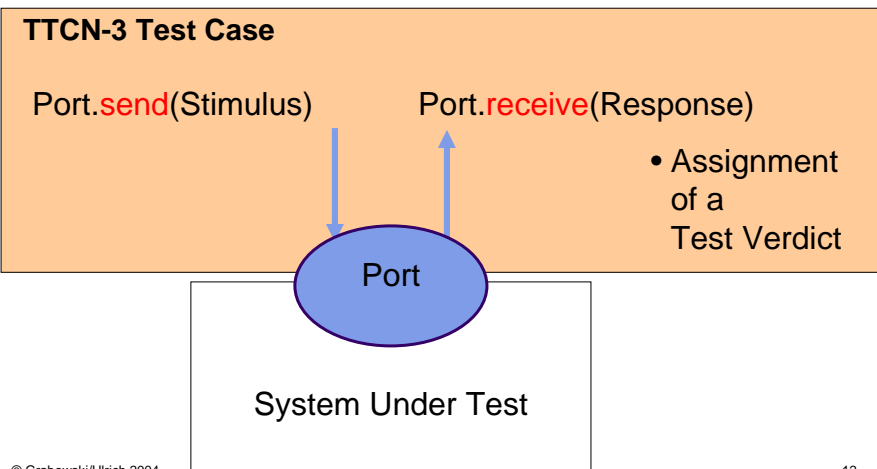

Concepts

- Black-Box Testing with TTCN-3
- Test Configuration
- Test Components
- Communication Ports
- Test Verdicts
- Main Elements of TTCN-3

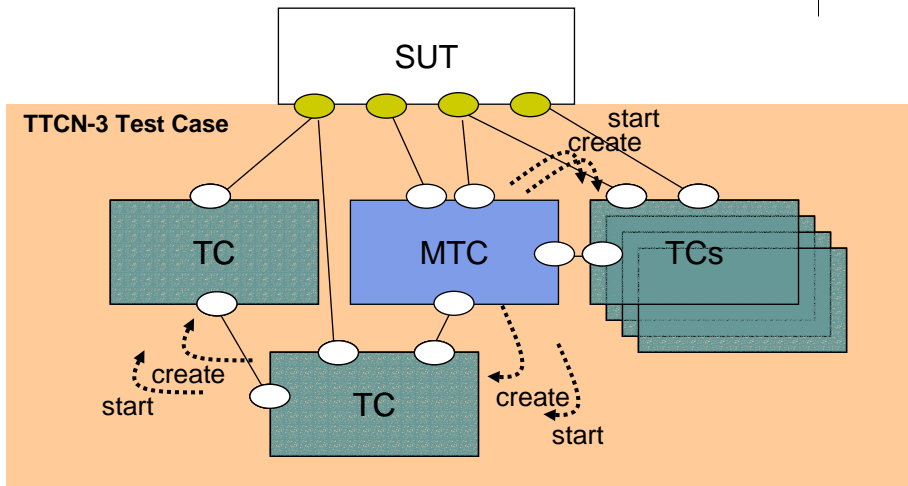

Concepts – Black-box testing with TTCN-3

Concepts – Test configuration

1(2)

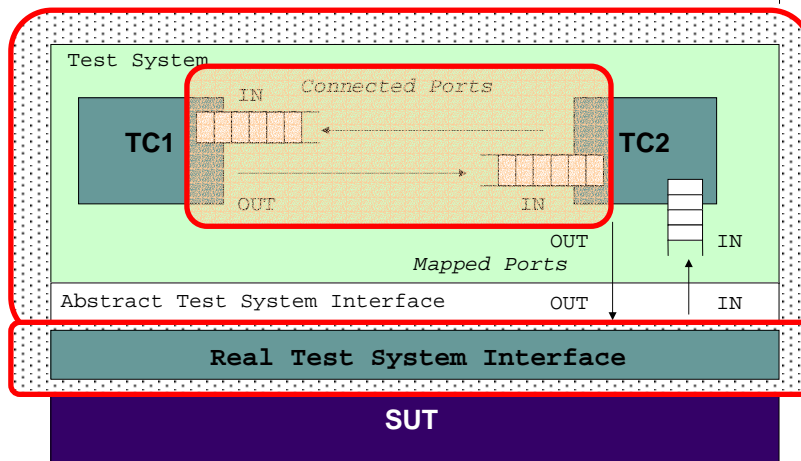

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

13

Concepts – Test configuration

2(2)

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

14

Concepts – Test components

- There are three 'kinds' of components
 - **Abstract Test System Interface** defined as component
 - **MTC** (Main Test Component)
 - **PTC** (Parallel Test Component)

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

15

Concepts – Communication ports

- Test components communicate via **ports**
- A test port is modeled as an **infinite FIFO queue**
- Ports have **direction** (in, out, inout)
- There are three types of port
 - **message-based**, **procedure-based** or **mixed**

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

16

Concepts – Test verdicts

- Test verdicts: **none** < **pass** < **inconc** < **fail** < **error**
- Each test component has its own local verdict, which can be set (**setverdict**) and read (**getverdict**).
- A test case returns a global verdict

Verdict returned by the test case when it terminates

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

17

Concepts – Main elements of TTCN-3

- Built-in and user-defined generic data types (e.g., to define messages, service primitives, information elements, PDUs).
- Actual test data transmitted/received during testing.
- Definition of the components and communication ports that are used to build various testing configurations.
- Specification of the dynamic test system behavior.

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

18

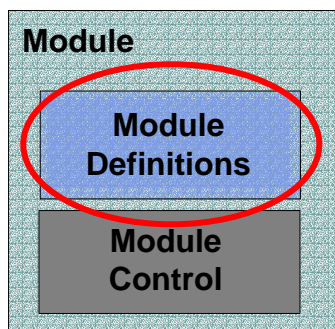

TTCN-3 language elements

- Module
- Module Definitions
 - Constants, Types, Templates
 - Port and Component Type Definitions
 - Functions
 - Altsteps
 - Test Cases
- Module Control

TTCN-3 language elements – Module

1(2)

- Modules are the building blocks of all TTCN-3 test specifications.
- A test suite is a module.
- A module has a definitions part and an (optional) control part.
- Modules can be parameterized.
- Modules can import definitions from other modules.

TTCN-3 language elements – Module

2(2)

```
module Example {  
  modulepar {  
    integer Par_One, Par_Two;  
    boolean Par_Three := true  
  }  
  import from AnotherModule {  
    ...  
  }  
  ... // all definitions  
  
  control {  
    ... // execution of test cases  
  }  
}
```

Module parameter
definitions with and
without default value

Import statement
(more details later)

Definitions
part

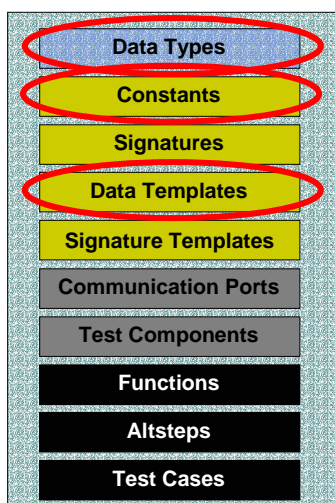

Control
part

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

21

TTCN-3 language elements – Module definitions

- Definitions are global to the entire module.
- Data Type definitions are based on TTCN-3 predefined and structured types.
- Templates define the test data.
- Ports and Components are used in Test Configurations.
- Functions, Altsteps and Test Cases define behavior.

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

22

TTCN-3 language elements – Constants, types, templates

```
const integer int_Const := 7;           // Normal constant
external const boolean bool_Const;     // External constant

type record Request { // Structured type definition
  RequestLine      requestLine,
  ReqMessageHeader reqMessageHeader optional,
  charstring       crlf,
  charstring       messageBody optional
}

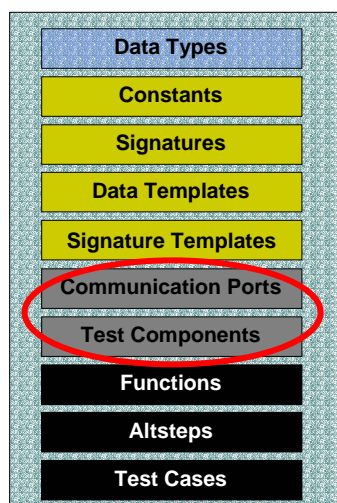

template Request Invite := { // template for the Request type
  requestLine      := Request_Line("INVITE"),
  reqMessageHeader := Req_Mes_Header("INVITE"),
  crlf             := CRLF,
  messageBody      := omit
}
```

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

23

TTCN-3 language elements – Module definitions (recall)

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

24

TTCN-3 language overview – Port & component type definitions

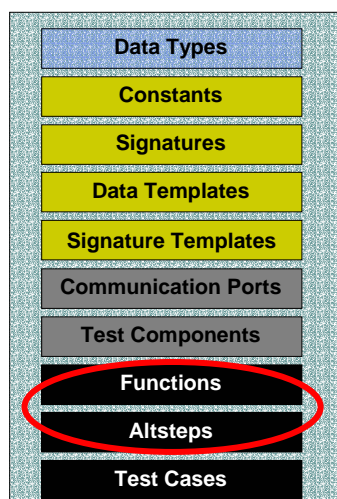

```
type port SipPortType message {  
    inout Request, Response;  
}  
  
type component SipTestComponent {  
    var integer Counter := 0;  
    timer T1 := 0.5;  
    timer T2 := 4.0;  
    port SipPortType SIP_PCO  
}
```

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

25

TTCN-3 language elements – Module definitions (recall)

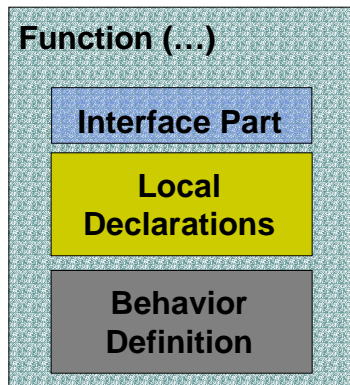

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

26

TTCN-3 language elements – Functions

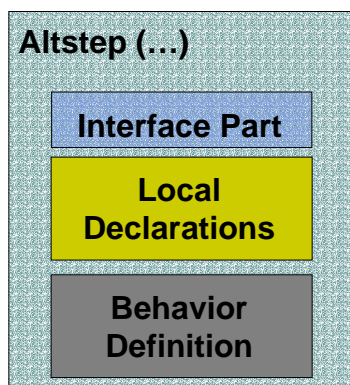

- ... allow to structure the test system behavior.
- ... have
 - a (optional) interface part,
 - a declarations part and
 - a behavior definition part.
- ... can be a 'pure' functions doing some data calculation or specify test behavior using communication operations such as send and receive.
- ... can be
 - user-defined,
 - external or
 - pre-defined.

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

27

TTCN-3 language elements – Altsteps

- ... are a special kind of function and have therefore the same structure as a normal function.
- ... allow to structure alternative behavior.
- ... can be activated as default behavior.

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

28

TTCN-3 language elements – Functions and altsteps

```
function postamble(charstring cseq) runs on SipTestComponent
{
    SIP_PCO.send(Bye_s_1(cseq));
}

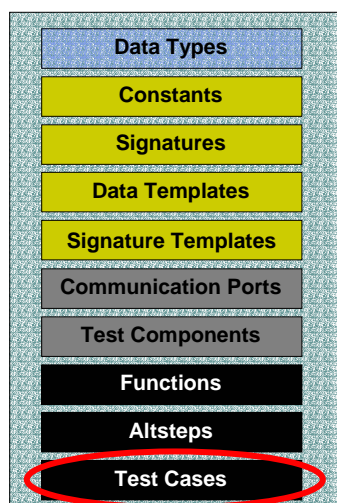

altstep Default_1(charstring cseq) runs on SIPTestComponent {
    [] any timer.timeout {
        ... // Behavior for unexpected timeout events
    }
    [] any port.receive {
        ... // Behaviour for unexpected message arrivals
    }
}
```

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

29

TTCN-3 language elements – Module definitions (recall)

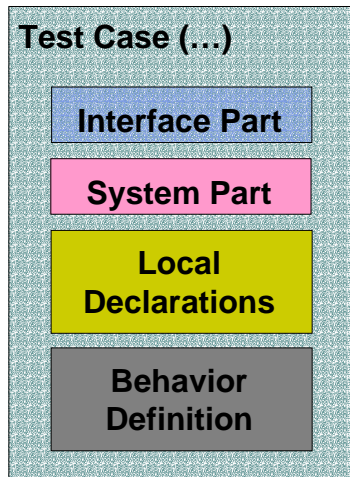

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

30

TTCN-3 language elements – Test cases 1(2)

- Test cases are a special kind of functions, which are executed in the control part of a module.
- The interface part references the MTC on which the test case will run.
- The system part refers to the test system interface component. It is optional and can be omitted if the test case only consists of an MTC
- The behavior definitions specifies the behavior of the MTC

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

31

TTCN-3 language elements – Test cases 2(2)

```
testcase SIP_UA_REC_V_001() runs on SipTestComponent
system configuration_01 {
    activate(Default_1("0"));
    map(self:SIP_PCO, system:SIP_PCO);
    SIP_PCO.send(Invite_s_1);
    Tl.start;
    SIP_PCO.receive(Response_r_1);
    setverdict(pass);
    Tl.stop;
    postamble("0");
    stop;
}
```

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

32

TTCN-3 language elements – Module (recall)

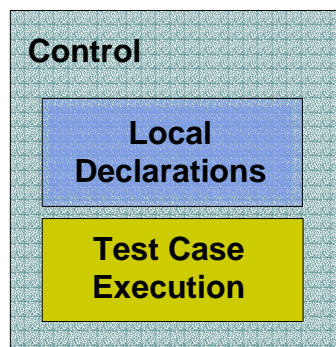

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

33

TTCN-3 language elements – Module control part 1(2)

- Module control is the 'dynamic' part of a TTCN-3 specification where the test cases are executed.
- Local declarations, such as variables and timers may be made in the control part.
- Basic programming statements may be used to select and control the execution of the test cases.

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

34

TTCN-3 language elements – Module control 2(2)

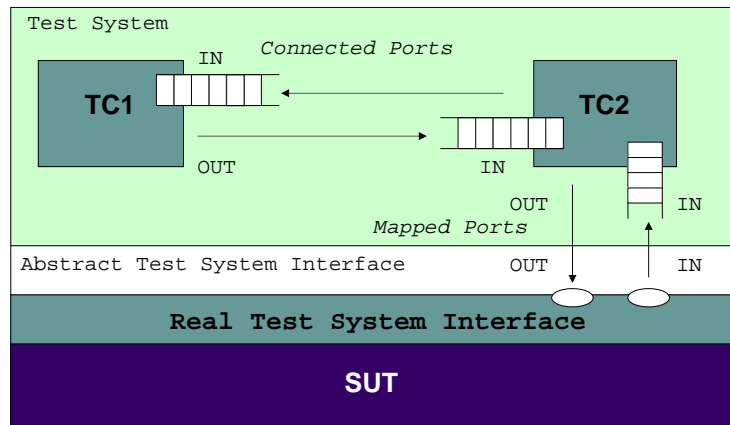

```
module ... {  
...  
  control{  
    var integer count;  
    if(execute(SIP_UA_REC_V_001()) == pass) {  
      // Execute test case 10 times  
      count := 0;  
      while( count <= 10) {  
        execute(SIP_UA_REC_V_002());  
        count := count + 1;  
      } // end while  
    } // end if  
  } // end control  
} // end module
```

TTCN-3 Test Behavior Specification

- Configuration Operations
- Procedure-based Communication
- Alternative Behavior
- Default Handling
- Overview

TTCN-3 test behavior spec. – Configuration operations 1(5)

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

37

TTCN-3 test behavior spec. – Configuration operations 2(5)

- Component Handling

- Create operation

```
var MyCompType MyNewComp;  
MyNewComp := MyCompType.create;
```

- Start operation

```
MyNewComp.start(MyCompBehavior(...));
```

- Stop operation

```
if (date == "1.1.2000") { stop; }
```

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

38

TTCN-3 test behavior spec. – Configuration operations 3(5)

- Component Handling (continued)
 - Running operation

```
if (MyNewComp.running) {  
    : // Do something  
}
```

- Done operation

```
all component.done;
```

TTCN-3 test behavior spec. – Configuration operations 4(5)

- Port Handling
 - Connect and Disconnect operations

```
connect(MyNewComp:Port1, mtc:Port3);  
disconnect(MyNewComp:Port1, mtc:Port3);
```

- Map and Unmap operation

```
map(self:Port2, system:PC01);  
unmap(self:Port2, system:PC01);
```

TTCN-3 test behavior spec. – Configuration operations 5(5)

- Port Handling (continued)
 - Start, Stop and Clear operations

```
MyPort.start;  
MyPort.stop;  
MyPort.clear;
```

TTCN-3 test behavior specification – Procedure-based communication 1(5)

- The details of message-based communication will be explained in the example (Part III).

- Therefore, only procedure-based communication will be explained here.

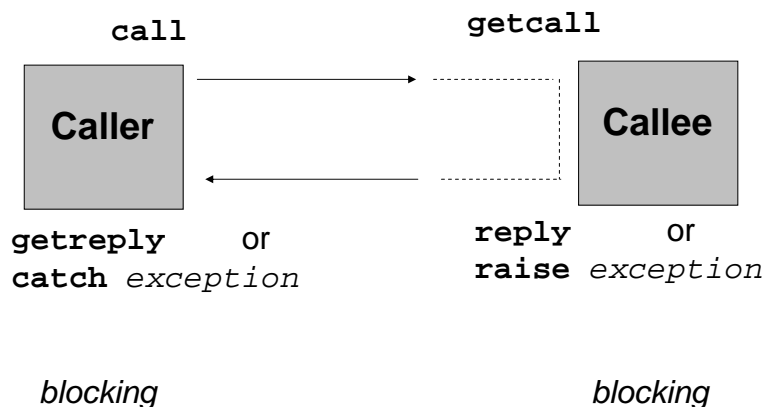

TTCN-3 test behavior specification – Procedure-based communication 2(5)

```
signature MyRemoteProc
  (in integer Par1,
   out float Par2,
   inout integer Par3)
  return integer
  exception (ExceptType1, ExceptType2);

template MyRemoteProc Mytemplate := {
  Par1 := 7,
  Par2 := *,
  Par3 := MyConst
}
```

TTCN-3 test behavior specification – Procedure-based communication 3(5)

TTCN-3 test behavior specification – Procedure-based communication 4(5)

```
MyCL.call(MyProcTemp(5,MyVar), 0.03) to MyPartner {  
  [] MyCL.getreply(MyProc:{MyVar1,MyVar2}) ->  
    value MyResult param (MyPar1Var,MyPar2Var){}  
  
  [] MyCL.catch(MyProc, MyExceptionOne) {  
    stop;  
  }  
  
  [] MyCL.catch(MyProc, MyExceptionTwo) {}  
  
  [] MyCL.catch(timeout) {  
    setverdict(fail);  
    stop;  
  }  
}
```

TTCN-3 test behavior specification – Procedure-based communication 5(5)

```
MyCL.getcall(MyProcTemp(5, MyVar)) -> sender MyPeer;
```

```
MyCL.reply(MyProc:{20, MyVar2} value 20) to MyPeer;
```

```
MyCL.raise(MyProc, MyVar + YourVar - 2) to MyPeer;
```

TTCN-3 test behavior spec. – Alternative behavior 1(2)

- ... has to be specified whenever test component is ready to take a response from the SUT or a timeout.
- ... is typically defined by several alternatives, which
 - are evaluated according to their appearance
 - may be guarded
 - can be part of an altstep, which may be called explicitly or activated as default.
- ... forks the test behavior (the typical „tree“), but in TTCN-3 alternatives can be joined again after the end of an alternative behavior.
- All other cases can be handled in an else branch.

TTCN-3 test behavior spec. – Alternative behavior 2(2)

```
alt {
  [] L1.receive(MyMessage1) {
    : // do something
  }
  [x>1] L2.receive(MyMessage2) {}
  [x<=1] L2.receive(MyMessage3) {}
  [] MyTeststep; // call of a teststep
  [else] stop // else branch
}
```

TTCN-3 test behavior spec. – Default handling

- Default handle

```
var default MyDefault := null;
```

- Activation of an altstep as default

```
MyDefault := activate (MyAltstep());
```

- Default deactivation

```
MyDefault := activate (MyAltstep());
```

TTCN-3 test behavior spec. – Overview

1(6)

Statement	Keyword or symbol	Module control part	Functions and test cases
Basic program statements			
Expressions	(...)	Yes	Yes
Assignments	:=	Yes	Yes
Logging	log	Yes	Yes
Label and Goto	label / goto	Yes	Yes
If-else	if (...) {...} else {...}	Yes	Yes
For loop	for (...) {...}	Yes	Yes
While loop	while (...) {...}	Yes	Yes
Do while loop	do {...} while {...}	Yes	Yes
Stop execution	stop	Yes	Yes

TTCN-3 test behavior spec. – Overview 2(6)

Statement	Keyword or symbol	Module control part	Functions and test cases
Behavior statements and operations			
Alternative behavior	alt {...}	(Yes)	Yes
Repeat alternative	repeat	(Yes)	Yes
Interleaved behavior	Interleave {...}	(Yes)	Yes
Returning Control	return		Yes
Statements for default handling			
Activate a default	activate	(Yes)	Yes
Deactivate a default	deactivate	(Yes)	Yes

TTCN-3 test behavior spec. – Overview 3(6)

Statement	Keyword or symbol	Module control part	Functions and test cases
Configuration operations			
Create	create		Yes
Connect ports	connect		Yes
Disconnect ports	disconnect		Yes
Map ports	map		Yes
Unmap ports	unmap		Yes
Get MTC id	mtc		Yes
Get system id	system		Yes
Get own id	self		Yes
Start component	start		Yes
Stop component	stop		Yes
Running comp.	running		Yes
Component done	done		Yes

TTCN-3 test behavior spec. – Overview 4(6)

Statement	Keyword or symbol	Module control part	Functions and test cases
Communication operations			
Send message	send		Yes
Call procedure	call		Yes
Reply to proc.	reply		Yes
Raise exception	raise		Yes
Receive message	receive		Yes
Trigger on mess.	trigger		Yes
Accept proc. call	getcall		Yes
Proc. reponse	getreply		Yes
Catch exception	catch		Yes
Check port	check		Yes
Clear port	clear		Yes
Start port	start		Yes
Stop port	stop		Yes

TTCN-3 test behavior spec. – Overview 5(6)

Statement	Keyword or symbol	Module control part	Functions and test cases
Timer operations			
Start timer	start	Yes	Yes
Stop timer	stop	Yes	Yes
Read elapsed time	read	Yes	Yes
Timeout event	timeout	Yes	Yes
Status check	running	Yes	Yes
Verdict operations			
Set local verdict	setverdict		Yes
Get local verdict	getverdict		Yes

TTCN-3 test behavior spec. – Overview 6(6)

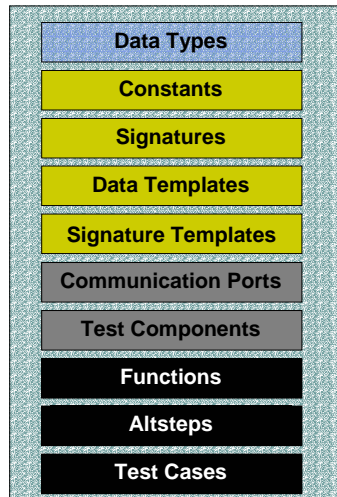

Statement	Keyword or symbol	Module control part	Functions and test cases
External actions			
Stimulate external action	<code>action</code>	Yes	Yes
Execution of test cases			
Execute test case	<code>execute</code>	(Yes)	Yes

Attributes, groups, import – Overview

- Attributes
- Grouping
- Importing from other Modules
- Importing non TTCN-3 Definitions

Attributes, groups, import – Module Definitions (recall)

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

57

Attributes, groups, import – Attributes 1(2)

- Attributes can be assigned to all kinds of definitions, groups and modules.
- Kinds of attributes
 - Encoding information
 - encode – attribute
 - variant – attribute
 - Values are standardized for ASN.1 encoding
 - Presentation information
 - display – attribute
 - Values are standardized for the graphical and tabular presentation format.
 - User-defined
 - extension - attribute

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

58

Attributes, groups, import – Attributes 2(2)

```
group MyPDUs {
  type record MyPDU1 { ... }
  group MySpecialPDUs {
    type record MyPDU3 { ... }
    with {extension "MyVerySpecialRule"}
    type record MyPDU4 { ... }
  }
  with {extension "MySpecialRule"}
}
with {
  display "PDU";
  extension "MyRule"
}
```

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

59

Attributes, groups, import – Grouping

```
group Logical_Group {
  import from ...
  modulepar ...
  const ...
  type ...
  function ...
  altstep ...
  testcase ...
  ...
  group Sub_Logical_Group {
    import from ...
    ...
  }
}
```

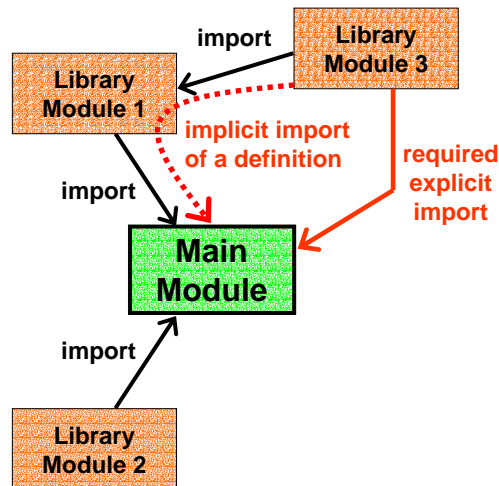

- TTCN-3 grouping mechanism allows to structure the module definitions part logically.
- Groups may also be structured into groups.
- Groups are no scope units.
- Groups can be used for the assignment of attributes to all definitions of the group.
- Groups of definitions can be imported.

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

60

Attributes, groups, import – Import from other modules 1(2)

- Main Module contains the control part, which specifies test suite execution.
- Modules may reuse definitions from other (library) modules.
- Implicit import of definitions via chains of imports is not allowed, i.e., an explicit import has to be added.
 - Reason: A module shall know all modules which it depends on.

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

61

Attributes, groups, import – Import from other modules 2(2)

```
import form ModuleOne {
  modulepar ModPar2;
  type RecordType_T2
}

import from ModuleTwo
recursive {
  testcase T_case
}

import from ModuleThree
all except {
  template all
}
```

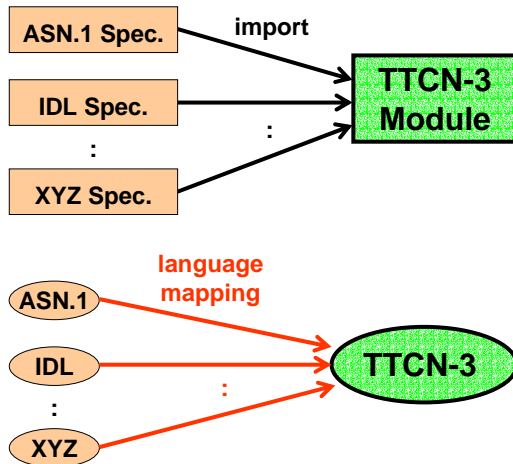

- Import allows to import
 - single definitions
 - definitions of a certain kind, and
 - groups of definitions from other modules.
- Definitions may be imported recursively.
- If several definitions are addressed, certain definitions can be excluded by using an except directive.

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

62

Attributes, groups, import – Importing non TTCN-3 definitions

- Importing non TTCN-3 definitions requires a language mapping onto TTCN-3.
- The language mapping defines the meaning of non TTCN-3 definitions in TTCN-3 modules.
- The language mapping may provide TTCN-3 additional features for imported definitions (e.g., operations for ASN.1 data types).

TTCN-3 User Conference 2004

63

PART II: The test application

The CSTA example
Test purposes

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

64

The CSTA example

1(4)

- CSTA = Services for Computer-Supported Telecommunications Applications
 - Defines OSI layer 7 communication between
 - Computing network (a PC in the simplest case) and
 - Telecommunication network (a PBX)

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

65

The CSTA example

2(4)

- CSTA standard
 - Standardized by Ecma International
 - European association for standardizing information and communication systems
 - <http://www.ecma-international.org/>
 - Developed in versions (= phases)
 - Current standard: CSTA phase III
 - Services: Ecma-269 (Jun. 2000)
 - ASN.1-based protocol: Ecma-285 (Jun. 2000)
 - XML-based protocol: Ecma-323 (Dec. 2002)
 - WSDL-based protocol: Ecma-348 (Jun. 2003)
- **Here: CSTA III XML**

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

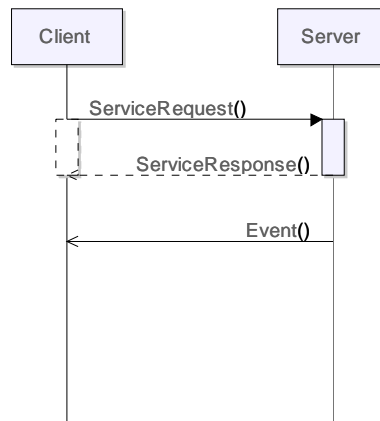

66

The CSTA example

3(4)

- CSTA communication
 - Message-based communication
 - XML coded
 - Client/server relationship
 - Service request
 - Service response
 - Events
 - Roles for client and server are interchangeable

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

67

The CSTA example

4(4)

- CSTA device
 - Allows users to access telecommunication services
 - Either physical (stations) or logical ones (e.g. call groups)
- CSTA call
 - Is a communication relationship between one or more devices
- CSTA connection
 - Is a relationship between a CSTA device and a call, in which the device is involved

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

68

Test purposes – Overview 1(7)

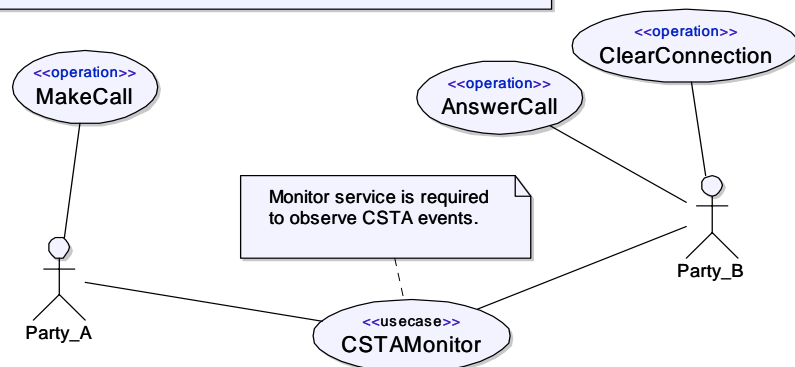

- CSTA service testing of switching function operations
- A telephony application shall apply some switching function services
 - Test purpose #1: Basic phone call between 2 parties
 - Test purpose #2: Conference call among 3 parties

Test purposes – Use case #1

2(7)

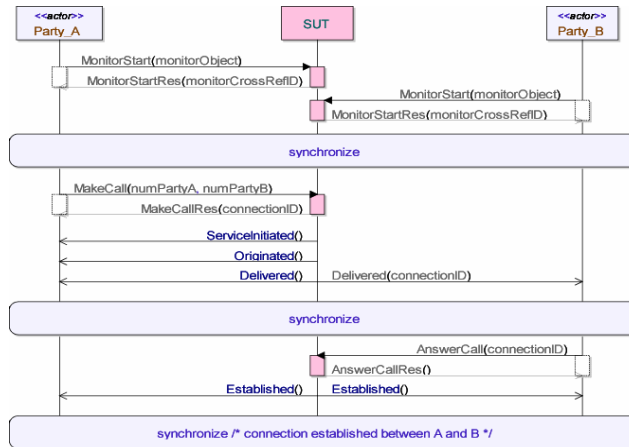

Test purpose #1: Party A establishes a call to B. B answers the call and terminates it later.

Test purposes – Sequence chart #1a

PART III: TTCN-3 en detail

Test architecture
Test data definitions
Test behavior description
Overall view of the test suite

Test architecture – Service testing

1(4)

Test architecture – TTCN-3 design

2(4)

- The SUT comprises all components (PBXs) that make up the Switching function domain
 - Is the **system** component in TTCN-3
- A Tester reflects a party in the Computing function domain
 - Implemented as a PTC in TTCN-3
 - Each tester manages its own CSTA message port
- Synchronization among testers
 - Implemented by means of an additional PTC “SyncHost” and applying the publisher/subscriber design pattern
- Creation of PTCs and mapping/connecting ports is done exclusively in the MTC (**testcase**)

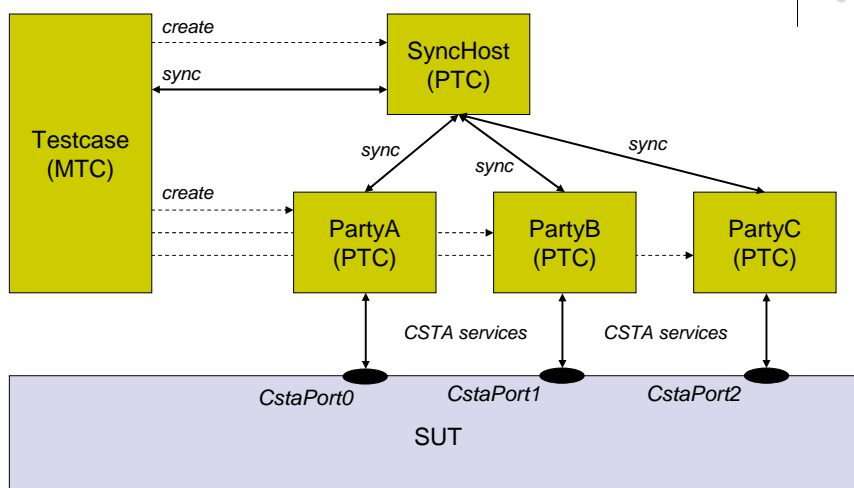

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

79

Test architecture – TTCN-3 design

3(4)

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

80

Test architecture – TTCN-3 design approach 4(4)

- Define the following parts of a TTCN-3 test suite
 1. Ports and components
SUT, MTC and (optional) PTCs
 2. In/out messages and procedure calls exchanged between tester components and SUT
 3. Tester-internal messages
 - E.g. synchronization messages
 4. Data templates of in/out messages
 5. Behavior definitions
 - Test cases
 - Functions and altsteps that run on components
 - Functions that manipulate data (without “runs on” attribute)
 - Consider definition of proper module parameters
 6. Control part to execute the defined test cases
- Distribute all definitions of your TTCN-3 project over a proper set of TTCN-3 modules

Test data definitions – CSTA messages 1(7)

- CSTA message types are given in XML schema definitions (XSD)
- Mapping required from XSD to TTCN-3 data types
 - Currently no standardized mapping rules defined
 - Project-specific, ad-hoc mappings prevail
- Message == record/union
 - Record may contain optional elements

```
type record MakeCall {
    DeviceID callingDevice,
    DeviceID calledDirectoryNumber,
    ...
    CSTACommonArguments extensions
                                optional
};
type integer DeviceID;
type record CSTACommonArguments {
    CSTASecurityData security
                                optional,
    CSTAPrivateData privateData
                                optional
};
type union CSTAPrivateData {
    octetstring string,
    bitstring private
};
```

Test data definitions – Party component

2(7)

- A Party is defined as a component (PTC)
 - CSTA port “cstaPort”
 - Accepts all in/out messages
 - Sync port
 - Timer “cstaTimer”
 - Timeout value set to “CstaTimeout” (module parameter)
 - Variable “syncHost”
 - Stores reference to the SyncHost component
 - Initialized to “null”

```
type port CstaPortType message {
    inout all;
}
type port SyncPortType message {
    inout SyncMsg;
}

type component PartyType {
    port CstaPortType cstaPort;
    port SyncPortType syncPort;
    timer cstaTimer := CstaTimeout;
    var SyncHostType syncHost :=
                                null;
}
```

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

83

Test data definitions – SUT and MTC definitions

3(7)

- The SUT is defined as another TTCN-3 component
 - Provides 3 separate CSTA ports for communication with parties
 - Implementation of these ports is done in TRI test adaptor
- The MTC is defined as component “MTC”
 - Provides a sync port to access and control the SyncHost component

```
// ports are already defined
type port CstaPortType message {
    inout all;
}
type port SyncPortType message {
    inout SyncMsg;
}

type component SUT {
    port CstaPortType cstaPort0;
    port CstaPortType cstaPort1;
    port CstaPortType cstaPort2;
}

type component MTC {
    port SyncPortType syncPort;
}
```

TTCN-3 User Conference 2004

84

Test data definitions – Templates

4(7)

- Templates define values and/or placeholders for each message field
- Out-message template
 - May contain parameters
 - Optional fields may be omitted (“omit”)
- In-message template
 - May contain parameters
 - May use placeholders
 - “?”: element **must** occur
 - “*”: element **may** occur in the received message

```
template MakeCall makeCallDefault
( in DeviceID sender_,
  in DeviceID receiver_ ) :=
{
  callingDevice := sender_,
  calledDirectoryNumber :=
                                receiver_,
  ...
  extensions := omit
}
template MakeCallResponse
  makeCallResponseDefault :=
{
  callingDevice := ?,
  mediaCallCharacteristics := *,
  initiatedCallInfo := *,
  extensions := *
}
```

85

Test data definitions – ASN.1 in TTCN-3

5(7)

```
ACSE-1 DEFINITIONS ::= BEGIN
ACSE-apdu ::= CHOICE
{
  aarg AARQ-apdu,
  ...
}
AARQ-apdu ::= SEQUENCE
{
  protocol-version BIT STRING,
  application-context-name
                        OBJECT IDENTIFIER,
  called-AP-title AP-title OPTIONAL,
  ...
  calling-authentication-value
                        Authentication-value OPTIONAL,
  ...
  user-information
                        Association-information OPTIONAL
}
END
```

```
import from ACSE_1 language "ASN.1:1997"
all with { encode "BER:1997" };

// corresponding TTCN-3 template
template ACSE_apdu acseAssociateRequest
(charstring authenticationValue) :=
{
  aarg := {
    protocol_version := '0'B,
    application_context_name :=
                                objid {1 3 12 0 218},
    called_AP_title := omit,
    ...
    calling_authentication_value := {
      charstr := authenticationValue
    },
    ...
    user_information := {
      ...
    }
  }
}
```

TTCN-3 User Conference 2004

86

Test data definitions – Module parameters

6(7)

- Module parameters are similar to constants
- Used here to describe test suite parameters
 - Timeout values
 - Characterization of a party
 - Name of the party
 - Phone number
 - Authentication string
- Can be imported like other definitions
- Tool providers may provide means for parameterization during test runtime

```
modulepar {
  // describes the test purpose
  charstring TestPurpose := "...";
  // timeout of the entire test case
  float TestCaseTimeout := 360.0;
  // CSTA connection timeout
  float CstaTimeout := 5.0;

  // total number of parties, 1..5
  integer TotalPartyNumber := 3;

  // party A
  charstring PartyNameA := "partyA";
  charstring PartyAuthA := "...";
  integer PartyNumberA := 1111;

  ...
}
```

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

87

Test data definitions – Import statements

7(7)

- Introduces definition identifiers from other modules into the current module
 - All definitions of a module
 - Explicit identifiers
- Often extended by encoding information
 - Predefined: "BER:1997"
 - User-defined: "Ecma323"

```
module cstaInitialization
{
  import from BaseDefinitions {
    type PartyType;
    type PeerSystemStatus;
    function convertSystemStatus;
  };

  import from ECMA323 {
    type SystemStatus,
      SystemStatusResponse,
      SystemStatusVal;
  } with { encode "Ecma323" };

  import from ACSE_1
    language "ASN.1:1997" all
    with { encode "BER:1997" };
}
```

TTCN-3 User Conference 2004

88

Test behavior description – Behavior functions (a) 1(9)

- Behavior functions run on a component (“runs on”)
 - Invoked at a component’s start or anytime during execution
 - May carry in/out/inout parameters
 - May define local variables at the beginning
- xmlMakeCall()
 - Requests the MakeCall service using template “makeCallDefault”
 - Waits for the service response using template “makeCallResponseDefault”
 - Returns the connection ID of the new call contained in the response message

```
function xmlMakeCall
( in DeviceID from_, in DeviceID to_,
  out ConnectionID connId )
runs on PartyType
{
  var MakeCallResponse mcrMsg;
  if(getverdict != fail) {
    cstaPort.send(makeCallDefault(
      from_, to_));
    cstaTimer.start;
    alt {
      [] cstaPort.receive(
        makeCallResponseDefault)
      -> value mcrMsg {
        cstaTimer.stop;
        connId := mcrMsg.callingDevice;
      }
    } /*tla*/
  } /*fi*/
}
```

Test behavior description – Behavior functions (b) 2(9)

- xmlCallClearedEvent()
 - Waits for the occurrence of the CallCleared event that matches template “callClearedEventDefault”
 - If it does not occur before “cstaTimer” times out, a default altstep will be activated then (outside the function definition)
 - Returns the connection ID contained in the event

```
template CallClearedEvent
callClearedEventDefault ( ... ) := { ... }

function xmlCallClearedEvent
( in MonitorCrossRefID monitorId,
  out ConnectionID connId )
runs on PartyType
{
  var CallClearedEvent event;

  if(getverdict != fail) {
    cstaTimer.start;
    alt {
      [] cstaPort.receive(
        callClearedEventDefault(...)
      ) -> value event {
        cstaTimer.stop;
        connId := event.clearedCall;
      }
    }
  }
}
```

Test behavior description – Behavior functions (c) 3(9)

- `scriptA()`
 - The overall function that implements the behavior of party A
 - Activates/deactivates default altsteps at the beginning and the end
 - If a message received in `xmlMakeCall()` does not match within this function, matching is attempted first in “`cstaEventCollector`”, then in “`cstaDefaultHandler`” (reverse activation order!)

```
function scriptA() runs on PartyType
{
  var default dh := activate(
    cstaDefaultHandler());
  var default cstaEventCollector :=
    activate(
      xmlDefaultEventHandler());
  ...

  xmlMakeCall(
    PartyNumberA, PartyNumberB,
    connId);

  ...

  deactivate(cstaEventCollector);
  deactivate(dh);
}
```

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

91

Test behavior description – Altsteps 4(9)

- Altsteps
 - Define a set of alternative behavior if a receive operation in an associated alt statement fails
- `cstaDefaultHandler()`
 - If activated, it matches any CSTA error message, any unidentified message and a timeout of the CSTA timer
 - “stop” statement stops execution of the component, on which the altstep was activated
 - Otherwise execution continues after associated alt statement

```
altstep cstaDefaultHandler()
runs on PartyType
{
  [] cstaPort.receive(CSTAErrorCode:?)
  {
    cstaTimer.stop;
    setverdict(fail);
    stop;
  }
  [] cstaPort.receive {
    ...
  }
  [] cstaTimer.timeout {
    log("Timeout received!");
    setverdict(inconc);
    // continue test execution
  }
}
```

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

92

Test behavior description – Testcases 5(9)

- A testcase is the initial function that must always exist in an executable TTCN-3 module
- `cstaTestCase()`
 - Static test configuration
 - Is defined on type “MTC” and uses the ports defined in “SUT”
 - Creates all test components of the test suite
 - Connects/maps to internal/external ports
 - Starts all components and waits for their termination
 - Disconnects/unmaps all ports

```
testcase cstaTestCase()
runs on MTC system SUT
{
  var SyncHostType sh :=
      SyncHostType.create;
  var PartyType partyA :=
      PartyType.create;
  connect(self:syncPort, sh:syncPort);
  connect(partyA:syncPort, sh:syncPort);
  map(partyA:cstaPort, system:cstaPort0);

  sh.start(syncHostMain());
  partyA.start(testScriptInit(1, sh));
  partyA.done;

  unmap(partyA:cstaPort,
        system:cstaPort0);
  disconnect(partyA:syncPort,
             sh:syncPort);
  disconnect(self:syncPort, sh:syncPort);
}
```

Test behavior description – Local concurrency 6(9)

- Concurrent messages received at the same port of a component must be handled properly
- Example from test purpose #2 of party A
 - After the ConsultationCall service the Held event occurs concurrently with the sequence of ServiceInitiated, Originated, Delivered events

```
// behavior of party A from #2
// after ConsultationCall
...
interleave {
[] cstaPort.receive(HeldEvent:?)
{ ... }
[] cstaPort.receive(
    ServiceInitiatedEvent:?)
{
  cstaPort.receive(
    OriginatedEvent:?)
  { ... }
  cstaPort.receive(
    DeliveredEvent:?)
  { ... }
}
}
```

Test behavior description – Implementing the TPs 7(9)

- Test purposes (TPs) given as sequence charts are implemented for each party separately as “scriptA()”, “scriptB()” etc.
 - Resembles a projection of actions in a sequence chart on the selected party
 - Relies on an existent synchronization mechanism between parties; here: function “sync()”
 - Projection could be done automatically
 - ➔ Test script generation

Test behavior description – Implementing TP #1 8(9)

```
function scriptA() runs on PartyType {
  var MonitorCrossRefID monitorId;
  var ConnectionID connId;

  xmlMonitorStart(PartyNumberA, monitorId);
  sync(); // null state
  xmlMakeCall(PartyNumberA, PartyNumberB, connId);
  xmlServiceInitiatedEvent(monitorId, connId);
  xmlOriginatedEvent(monitorId, connId);
  xmlDeliveredEvent(monitorId, connId);
  sync(); // connected state

  xmlEstablishedEvent(monitorId, connId);
  sync(); // connected state
  log("connection established for A");

  xmlFailedEvent(monitorId, connId);
  xmlConnectionClearedEvent(monitorId, connId);
  xmlFailedEvent(monitorId, connId);
  xmlConnectionClearedEvent(monitorId, connId);
  sync(); // null state
  xmlMonitorStop(monitorId);
}
```

```
function scriptB() runs on PartyType {
  var MonitorCrossRefID monitorId;
  var ConnectionID connId;

  xmlMonitorStart(PartyNumberB, monitorId);
  sync(); // null state
  xmlDeliveredEvent(monitorId, connId);

  sync(); // alerting state
  xmlAnswerCall(connId);
  xmlEstablishedEvent(monitorId, connId);
  sync(); // connected state
  log("connection established for B");
  sleep(2.0);
  xmlClearConnection(connId);
  xmlFailedEvent(monitorId, connId);
  xmlConnectionClearedEvent(monitorId, connId);

  sync(); // null state
  xmlMonitorStop(monitorId);
}
```

Test behavior description – Implementing TP #2 9(9)

```
function scriptA()
runs on PartyType {
xmlMonitorStart();
sync(); // null state
xmlMakeCall();
xmlServiceInitiatedEvent();
xmlOriginatedEvent();
xmlDeliveredEvent();
sync(); // connected state

xmlEstablishedEvent();
sync(); // connected state
log("connection A with B");
xmlConsultationCall();
xmlHeldEvent();
xmlServiceInitiatedEvent();
xmlOriginatedEvent();
xmlDeliveredEvent();
sync(); // connected state

xmlEstablishedEvent();
log("connection A with C");
xmlConferenceCall();
xmlConferencedEvent();
sync(); // connected state
log("Connection for A, B, C");
}
--
```

© Grabowski/Ulrich 2004

```
function scriptB()
runs on PartyType {
xmlMonitorStart();
sync(); // null state

xmlDeliveredEvent();
sync(); // alerting state
xmlAnswerCall();
xmlEstablishedEvent();
sync(); // connected state
log("connection B with A");
xmlHeldEvent();

sync(); // hold state

xmlConferencedEvent();
sync(); // connected state
log("Conference for B, A, C");
}
--
```

TTCN-3 User Conference 2004

```
function scriptC()
runs on PartyType {
xmlMonitorStart();
sync(); // null state

sync(); // null state

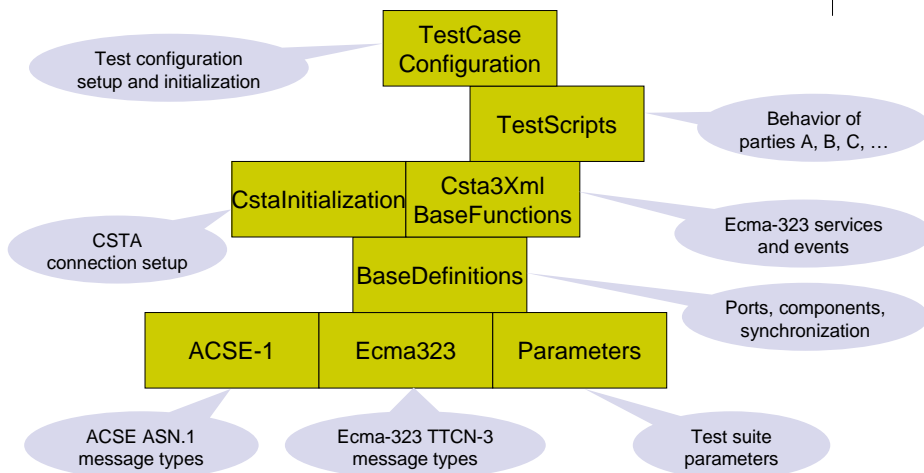

sync(); // null state

xmlDeliveredEvent();
sync(); // alerting state
xmlAnswerCall();
xmlEstablishedEvent();
log("connection C with A");

xmlConferencedEvent();
sync(); // connected state
log("Conference for C, A, B");
}
--
```

PART IV: Conclusions and outlook

On the user's acceptance of TTCN-3
 Conclusions
 TTCN-3 extensions
 TTCN-3 tool providers

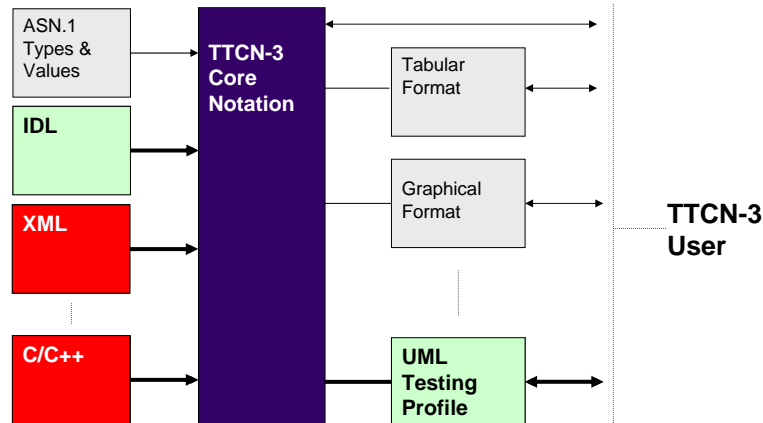

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

100

On the user's acceptance of TTCN-3 ingredients

1(4)

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

101

On the user's acceptance of TTCN-3 ingredients

2(4)

- Well accepted
 - TTCN-3 core notation
 - ASN.1 handling
- Strong interest
 - UML testing profile (work not yet completed)
 - XML mapping (work not yet completed)
 - C/C++ mapping (work will start)
- No feedback
 - IDL mapping

© Grabowski/Ulrich 2004

TTCN-3 User Conference 2004

102

On the user's acceptance of TTCN-3 ingredients

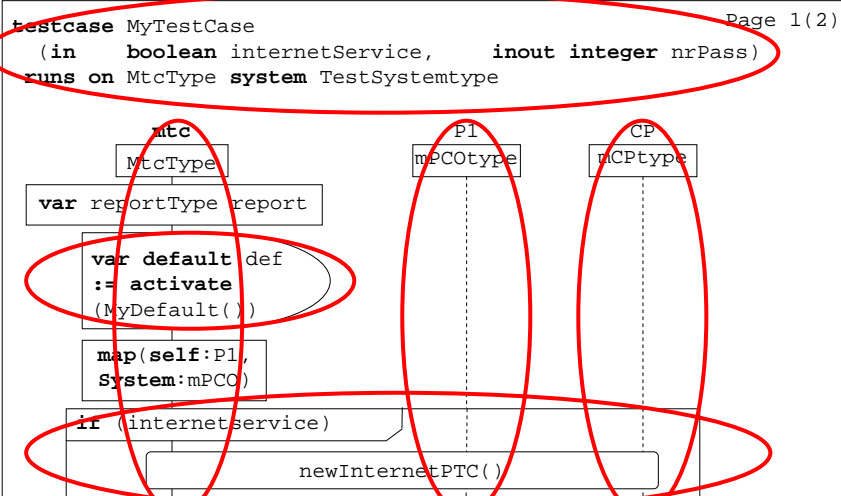

3(4)

- Small or no interest
 - Tabular presentation format
 - Graphical presentation format
 - Users don't see an advantage of the one-to-one mapping
 - The UML testing profile (U2TP) mapping to TTCN-3 is no one-to-one mapping, but in some points more like test generation

On the user's acceptance of TTCN-3 ingredients

4(4)

Conclusions

- TTCN-3 finds its way into practice
- Lots of interest in industry as well as in academia in TTCN-3
- Stimulates further work and research
- Still issues to be improved
- Still possibilities to influence the future of TTCN-3

TTCN-3 extensions

- Planned for next edition of TTCN-3 standard in Dec. 2004
- Work items
 - Language extensions mechanisms
 - Packages and profiles
 - Extended communication mechanisms
 - Broadcast / multicast
 - Synchronization / coordination
 - Real-time extensions
 - Absolute time support
 - Time-constrained operations
 - Better performance testing support
 - Implicit test configuration
 - Implicit communication
 - Performance measurement

TTCN-3 tool providers

- Tool Provider
 - Testing Technologies
 - Telelogic
 - Danet
 - DaVinci Communication
 - Strategic Test Solutions
 - Open TTCN
- Internal
 - Nokia
 - Ericsson
 - Motorola
- Test Devices
 - Alcatel A1100
 - Navtel InterWatch
 - Nethawk
 - Tektronix G20
